# Major Cyber Security Project

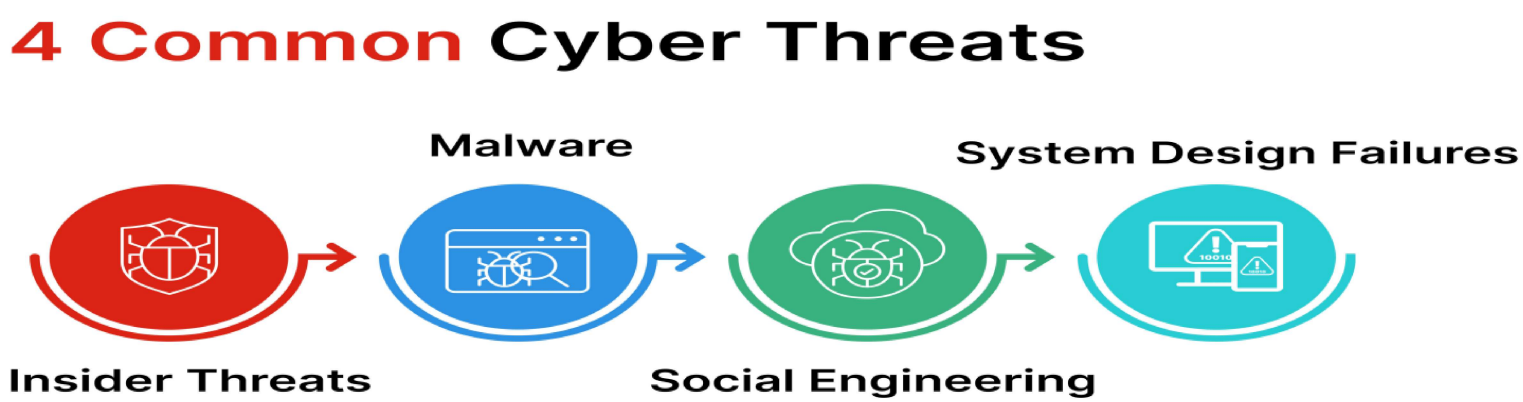
## AIM: Phishing Awareness Simulation

Name : Anshu Porwal

Collage: Ujjain Engineering College,Ujjain

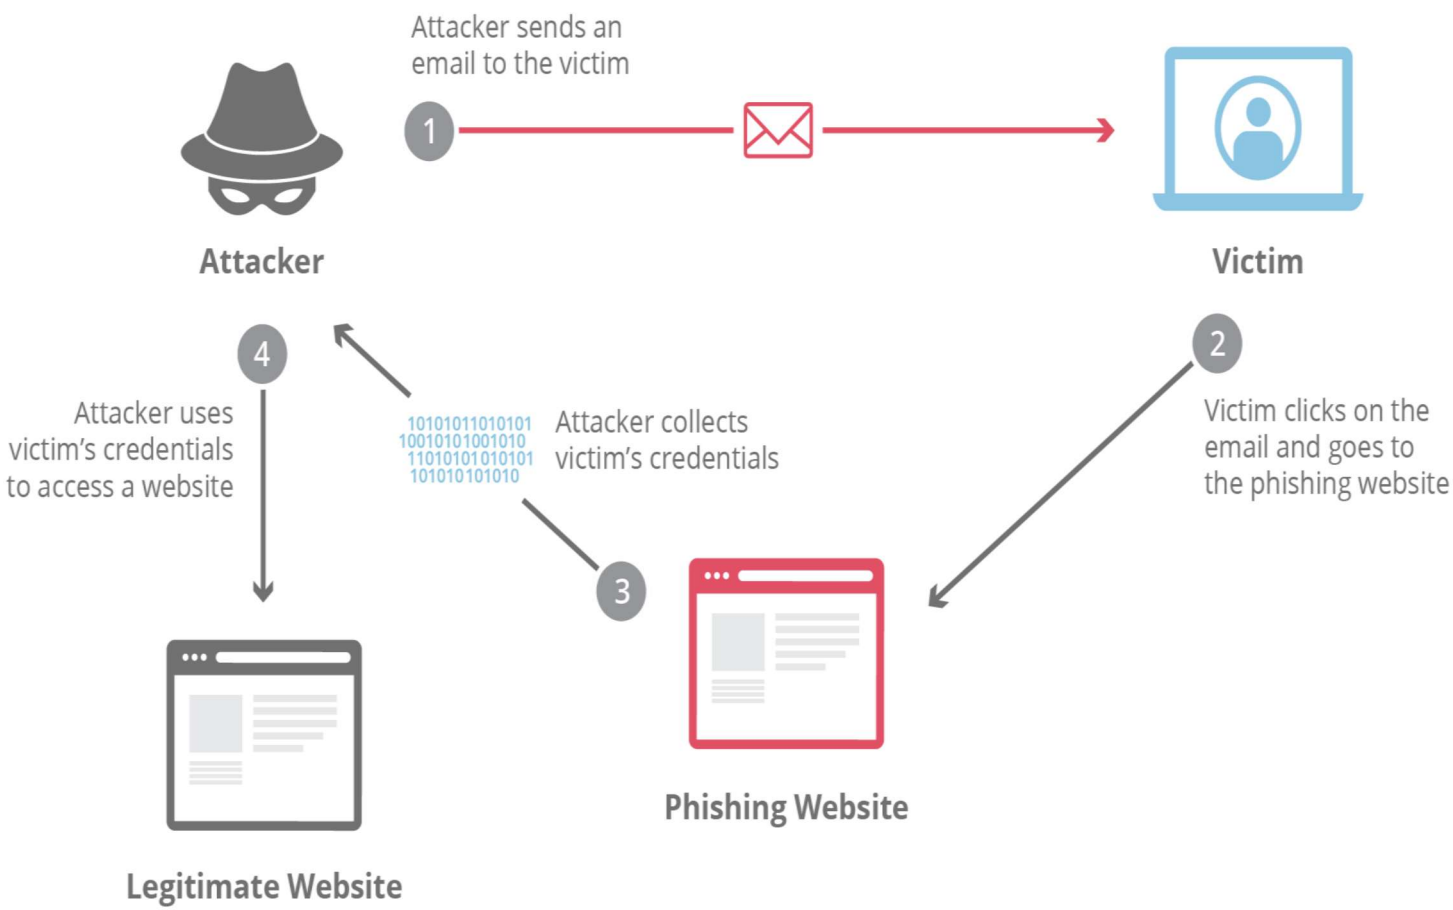
# Introduction of Cyber Security

- The rise in digital cyberattacks has made cybersecurity a priority for businesses and individuals. For businesses, cybercrimes can lead to financial loss, operational disruption, data breaches, and a loss of trust, while individuals face identity theft, financial fraud, and privacy invasion.

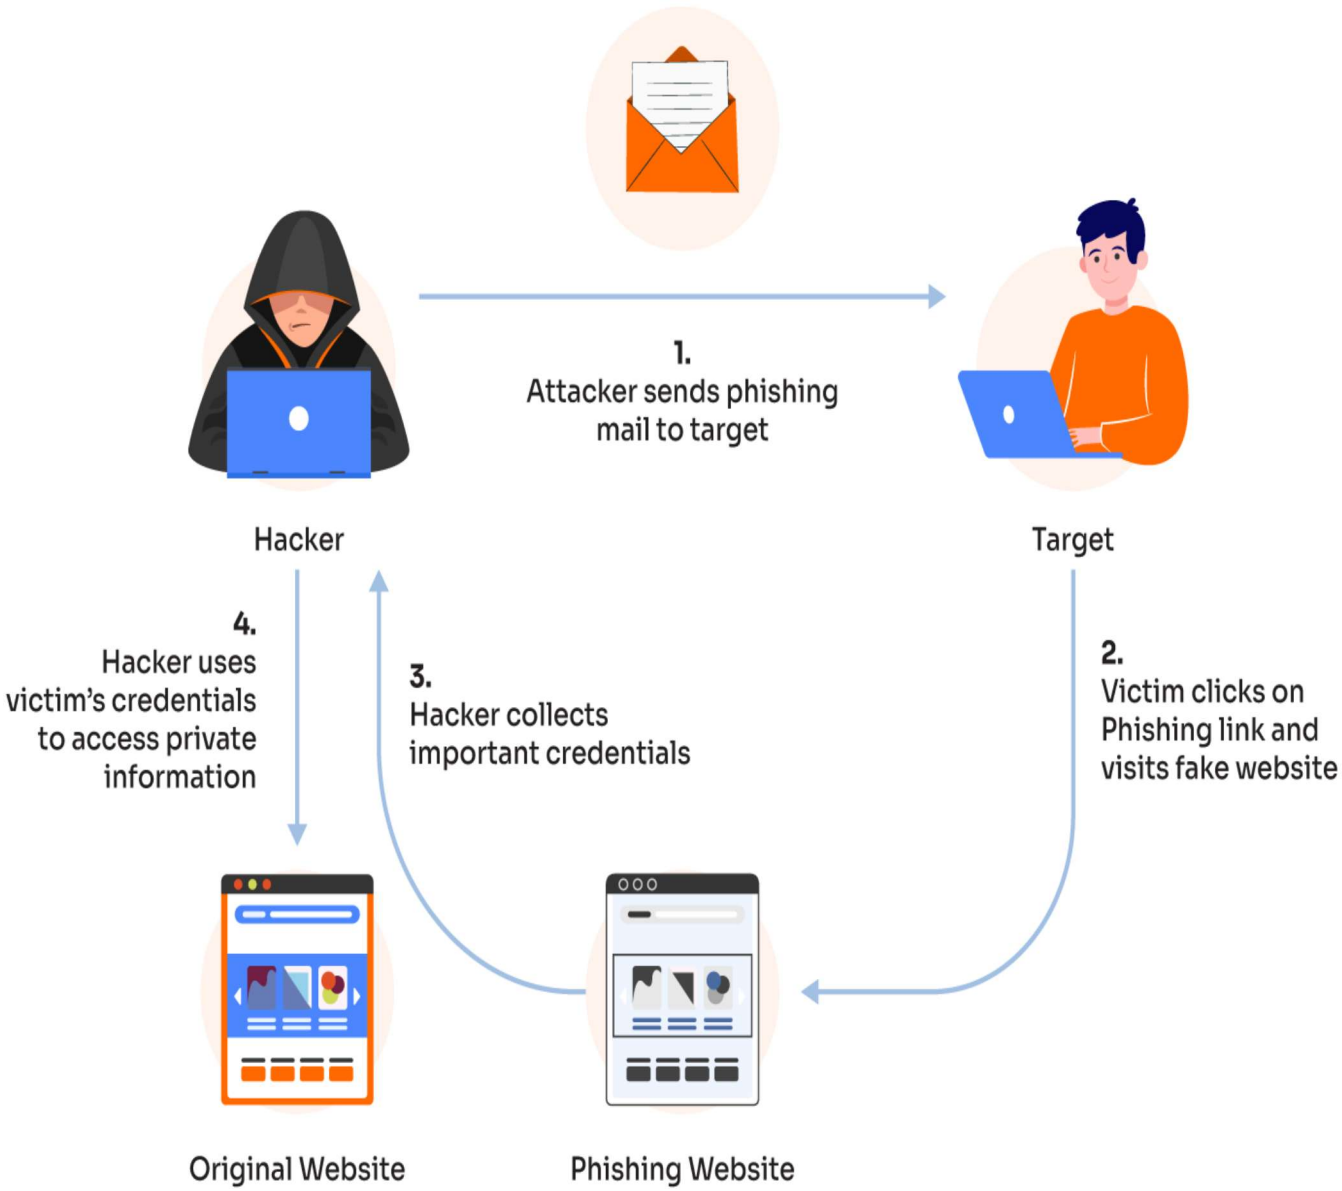


# Introduction of Phishing

"Phishing" refers to an attempt to steal sensitive information, typically in the form of usernames, passwords, credit card numbers, bank account information, or other important data in order to utilize or sell the stolen information.



# Project Objective



- Understand phishing attacks
- Simulate phishing email
- Measure user awareness
- To suggest prevantation techniques

# Types of Phishing

**1. Spear phishing :** Spear phishing involves targeting a specific individual in an organization to try to steal their **login credentials**.

**2. Vishing :** Vishing, which is short for "voice phishing," is when someone uses the phone to try to steal information. The attacker may pretend to be a trusted friend or relative or to represent them.

**3. Email phishing :** In an **email phishing** scam, the attacker sends an email that looks legitimate, designed to trick the recipient into entering information in reply or on a site that the hacker can use to steal or sell their data.

**4. Pharming :** In a **pharming** attack, the victim gets malicious code installed on their computer. This code then sends the victim to a fake website designed to gather their login credentials.

**5. Pop-up phishing :** Pop-up phishing often uses a pop-up about a problem with your computer’s security or some other issue to trick you into clicking.

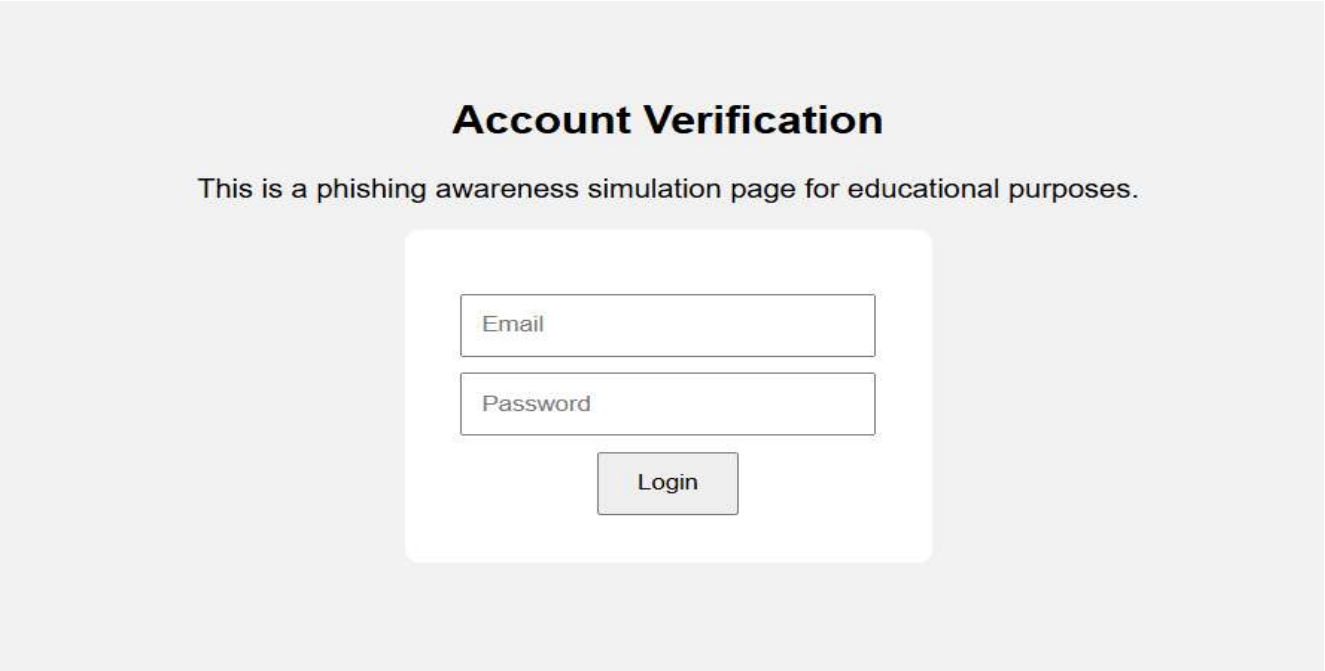
# Methodology

- Create phishing email
- Create fake login page
- Send to test group
- Collect results

# Tools used

Tools used in this project:

- HTML and CSS
- Gmail
- Google forms
- Web browser
- Ms word and power point



# Simulation Results

Example Results:

Out of 20 users:

- 12 clicked the link
- 6 entered information
- 8 ignored email

# Prevention Methods

Ways to prevent Phishing:

- Verify sender email
- Avoid suspicious links
- Use MFA
- Security awareness training
- Enable Multi-factor Authentification

User
↓
Firewall
↓
Antivirus
↓
Authentication
↓
Secure Database

# Conclusion

- Phishing awareness simulations help improve cybersecurity knowledge and reduce risks.
- No single technology will completely stop phishing attacks.
- Our web application verify the student ID and password effectively to reduce phishing effect.
